Abstract

We all know that to run a business customers are important. The business people believe that "customers should be treated as Gods". To maintain relationship between customer and owner and their trust is more important to run a business for long term. Here we get a solution for that, using our Customer Segmentation that company could know about the customer and produce products, give special offers and act according to customer needs, so there would be a great relationship between customer and owner. We used Machine Learning in R, we visualize and analyse the data based on age, gender, income and spending score. We also use clustering Techniques. We try increase the clusters of customers

Domains where our solution can be implemented

Companies,Business,Dealers, etc;

Our solution helping the selected domains

The companies, businesses, dealers etc, who are selling or sells products get benefit of our project

Our engineering solution

Using Machine Learning Customer Segmentation to know about customers analysis on products, based on age, income, gender and spending score.

Team's vision

Our main vision is to segment customers and make easy to companies to *release* products and offers according to that data.
